

GROW YOUR HAIR IN THE COMFORT OF YOUR OWN HOME!

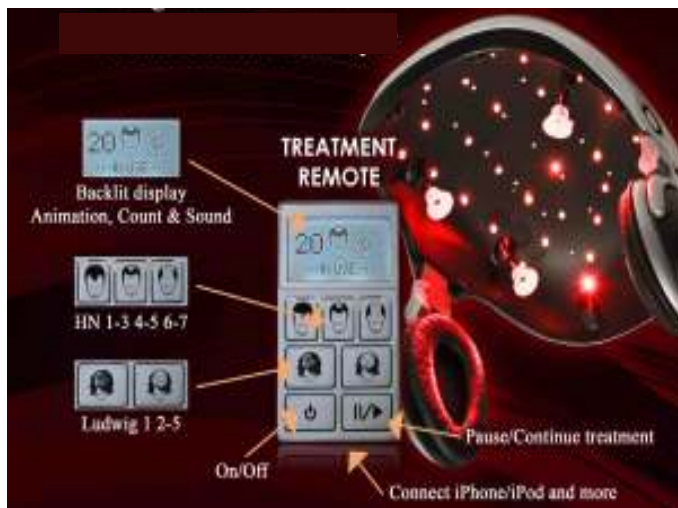

– Breakthrough Home Hair Restoration Therapy

The technology for low-level laser hair restoration has arrived in Singapore and is now readily available in Asia HealthPartners at an affordable price.

Existing therapies and medications to treat hair loss have been effective, and now there is a home-device which you can use as an adjunct to further thicken and grow your tresses!

iGrow, a low-level laser therapy is fast emerging as an alternative for hair restoration. Clinical research has proven that laser therapy significantly promotes hair growth. It utilizes a specific spectrum of red light (low level light therapy) to boost the energy-producing component of the cell, which rejuvenates hair thickness and promotes follicle health. Reports show increased hair growth and density of up to 40% over a year.

The laser used is FDA approved for hair restoration and is safe to use. There is no risk of burning the skin, no other detrimental long term side effects and is painless. Patients who are unable to take medications can use this therapy as an alternative too.

iGrow is convenient for use at home at your own leisure. Just 20 minutes, twice a week! With hands-free operation, you can use the computer, listen to music or read while the iGrow provides an effective laser therapy session.
